## INSTRUCTIONS TO CANDIDATES

These instructions are the same on the Printed Answer Book and the Question Paper.

- The Question Paper will be found inside the Printed Answer Book.
- Write your name, centre number and candidate number in the spaces provided on the Printed Answer Book. Please write clearly and in capital letters.
- Write your answer to each question in the space provided in the Printed Answer Book. If additional space is required, you should use the lined page(s) at the end of this booklet. The question number(s) must be clearly shown.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Answer all the questions.
- Do not write in the barcodes.
- You are permitted to use a scientific or graphical calculator in this paper.
- Final answers should be given to a degree of accuracy appropriate to the context.

## INFORMATION FOR CANDIDATES

This information is the same on the Printed Answer Book and the Question Paper.

- The number of marks is given in brackets [ ] at the end of each question or part question on the Question Paper.
- You are advised that an answer may receive no marks unless you show sufficient detail of the working to indicate that a correct method is being used.
- The total number of marks for this paper is 72.
- The Printed Answer Book consists of 16 pages. The Question Paper consists of 4 pages. Any blank pages are indicated.

## INSTRUCTION TO EXAMS OFFICER/INVIGILATOR

- Do not send this Question Paper for marking; it should be retained in the centre or recycled. Please contact OCR Copyright should you wish to re-use this document.

1 A food manufacturer produces baby food, which should not contain more than 30 mg of salt per jar on average. For quality control purposes the food manufacturer tests a random sample of jars every week.

In a particular week, the amounts of salt, $x \mathrm{mg}$, in a random sample of 16 jars are measured. The results are summarised as follows:

$$
\sum x=492, \quad \sum x^{2}=15186
$$

(i) (A) Why is a test based on the Normal distribution not appropriate in this case?
(B) Carry out a $t$ test, at the $5 \%$ significance level, to test whether the mean amount of salt per jar exceeds 30 mg . You may assume that all the conditions required for the $t$ test are fulfilled.
(ii) Construct a $95 \%$ confidence interval for the true mean amount of salt per jar.
(iii) The marketing director says that there is a $95 \%$ chance that the true mean amount of salt lies in this interval. Explain what is wrong with the marketing director's statement, and write an improved statement interpreting the meaning of a $95 \%$ confidence interval.

2 (i) In a dance contest, judges award each competitor a mark between 1.0 and 10.0 , inclusive. Marks are given to one decimal place. There is some concern that Judge 1 awards higher marks on the whole than Judge 2. The marks given by those two judges, for a random sample of 8 competitors, are as follows.

| Competitor | A | B | C | D | E | F | G | H |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Judge 1 | 9.9 | 3.4 | 8.1 | 4.0 | 7.2 | 4.7 | 4.2 | 3.8 |
| Judge 2 | 7.4 | 5.7 | 6.5 | 8.1 | 4.2 | 1.6 | 3.4 | 6.0 |

(A) Explain why a $t$ test might not be appropriate in this case.
(B) Carry out an appropriate test, at the 5\% significance level, to test whether Judge 1 awards higher marks on the whole than Judge 2.
(ii) In a different round of the contest, the judges were instructed to award only integer marks between 3 and 10 inclusive. One of the organisers believes that the eight possible marks are equally likely to be awarded. To check this he obtains the following random sample of 80 marks awarded.

| Mark | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frequency | 5 | 6 | 10 | 9 | 14 | 16 | 14 | 6 |

Carry out a goodness of fit test, with a significance level of $10 \%$, to investigate the organiser's belief.

3 The random variable $X$ has the following probability density function, $\mathrm{f}(x)$.

$$
\mathrm{f}(x)= \begin{cases}\frac{1}{108} x^{2}(6-x) & \text { for } 0 \leqslant x \leqslant 6 \\ 0 & \text { otherwise }\end{cases}
$$

(i) Sketch the probability density function.
(ii) Find the mode of $X$.
(iii) Find the mean of $X$ and show that the standard deviation of $X$ is $\frac{6}{5}$.
(iv) Let $\bar{X}$ be the mean of a random sample of 50 observations of $X$. Find $\mathrm{P}(\bar{X}>4)$.

Why did you need to use the Central Limit Theorem to find this probability?

4 A fishmonger sells two types of fish, mackerel and trout. The weights of fish are Normally distributed, with means and standard deviations shown in the table below.

| Fish | Mean weight $(\mathrm{kg})$ | Standard deviation $(\mathrm{kg})$ |
| :--- | :---: | :---: |
| Mackerel | 0.468 | 0.067 |
| Trout | 0.395 | 0.093 |

(i) Find the probability that a randomly chosen mackerel weighs more than 0.5 kg .
(ii) Find the probability that a randomly chosen mackerel weighs less than a randomly chosen trout.
(iii) Mackerel costs $£ 3.50$ per kg and trout $£ 4.00$ per kg . Tim buys one mackerel and two trout, chosen randomly. Find the probability that he pays more than $£ 5$.
(iv) The fishmonger offers a discount for buying 10 or more mackerel. The discounted price is $£ w$ per kg.
(A) Let $£ D$ be the discounted price of 10 mackerel. Find, in terms of $w$, the mean and standard deviation of $D$.
(B) The probability that, with the discount, 10 mackerel cost less than $£ 14$ should not be greater than 0.1 . Find the smallest possible value of $w$.

## END OF QUESTION PAPER

## Annotations and abbreviations

| Annotation in scoris | Meaning |
| :--- | :--- |
| $\checkmark$ and $\mathbf{x}$ |  |
| BOD | Benefit of doubt |
| FT | Follow through |
| ISW | lgnore subsequent working |
| M0, M1 | Method mark awarded 0, 1 |
| A0, A1 | Accuracy mark awarded 0, 1 |
| B0, B1 | Independent mark awarded 0, 1 |
| SC | Special case |
| ^ | Omission sign |
| MR | Misread |
| Highlighting |  |
|  |  |
| Other abbreviations <br> in mark scheme | Meaning |
| E1 | Mark for explaining |
| U1 | Mark for correct units |
| G1 | Mark for a correct feature on a graph |
| M1 dep* | Method mark dependent on a previous mark, indicated by * |
| cao | Correct answer only |
| oe | Or equivalent |
| rot | Rounded or truncated |
| soi | Seen or implied |
| www | Without wrong working |

|  |  |

## Subject-specific Marking Instructions for GCE Mathematics (MEI) Statistics strand

a
Annotations should be used whenever appropriate during your marking.
The $A, M$ and $B$ annotations must be used on your standardisation scripts for responses that are not awarded either 0 or full marks. It is vital that you annotate standardisation scripts fully to show how the marks have been awarded.

For subsequent marking you must make it clear how you have arrived at the mark you have awarded.
An element of professional judgement is required in the marking of any written paper. Remember that the mark scheme is designed to assist in marking incorrect solutions. Correct solutions leading to correct answers are awarded full marks but work must not be judged on the answer alone, and answers that are given in the question, especially, must be validly obtained; key steps in the working must always be looked at and anything unfamiliar must be investigated thoroughly

Correct but unfamiliar or unexpected methods are often signalled by a correct result following an apparently incorrect method. Such work must be carefully assessed. When a candidate adopts a method which does not correspond to the mark scheme, award marks according to the spirit of the basic scheme; if you are in any doubt whatsoever (especially if several marks or candidates are involved) you should contact your Team Leader.

The following types of marks are available.
M
A suitable method has been selected and applied in a manner which shows that the method is essentially understood. Method marks are not usually lost for numerical errors, algebraic slips or errors in units. However, it is not usually sufficient for a candidate just to indicate an intention of using some method or just to quote a formula; the formula or idea must be applied to the specific problem in hand, eg by substituting the relevant quantities into the formula. In some cases the nature of the errors allowed for the award of an M mark may be specified

## A

Accuracy mark, awarded for a correct answer or intermediate step correctly obtained. Accuracy marks cannot be given unless the associated Method mark is earned (or implied). Therefore M0 A1 cannot ever be awarded.

## B

Mark for a correct result or statement independent of Method marks.

## E

A given result is to be established or a result has to be explained. This usually requires more working or explanation than the establishment of an unknown result.

Unless otherwise indicated, marks once gained cannot subsequently be lost, eg wrong working following a correct form of answer is ignored. Sometimes this is reinforced in the mark scheme by the abbreviation isw. However, this would not apply to a case where a candidate passes through the correct answer as part of a wrong argument.

When a part of a question has two or more 'method' steps, the M marks are in principle independent unless the scheme specifically says otherwise; and similarly where there are several B marks allocated. (The notation 'dep *' is used to indicate that a particular mark is dependent on an earlier, asterisked, mark in the scheme.) Of course, in practice it may happen that when a candidate has once gone wrong in a part of a question, the work from there on is worthless so that no more marks can sensibly be given. On the other hand, when two or more steps are successfully run together by the candidate, the earlier marks are implied and full credit must be given.

The abbreviation ft implies that the A or B mark indicated is allowed for work correctly following on from previously incorrect results. Otherwise, $A$ and $B$ marks are given for correct work only - differences in notation are of course permitted. A (accuracy) marks are not given for answers obtained from incorrect working. When A or B marks are awarded for work at an intermediate stage of a solution, there may be various alternatives that are equally acceptable. In such cases, exactly what is acceptable will be detailed in the mark scheme rationale. If this is not the case please consult your Team Leader.

Sometimes the answer to one part of a question is used in a later part of the same question. In this case, A marks will often be 'follow through'. In such cases you must ensure that you refer back to the answer of the previous part question even if this is not shown within the image zone. You may find it easier to mark follow through questions candidate-by-candidate rather than question-by-question.

Wrong or missing units in an answer should not lead to the loss of a mark unless the scheme specifically indicates otherwise.
Candidates are expected to give numerical answers to an appropriate degree of accuracy. 3 significant figures may often be the norm for this, but this always needs to be considered in the context of the problem in hand. For example, in quoting probabilities from Normal tables, we generally expect some evidence of interpolation and so quotation to 4 decimal places will often be appropriate. But even this does not always apply - quotations of the standard critical points for significance tests such as $1.96,1.645,2.576$ (maybe even 2.58 - but not 2.57 ) will commonly suffice, especially if the calculated value of a test statistic is nowhere near any of these values. Sensible discretion must be exercised in such cases.

Discretion must also be exercised in the case of small variations in the degree of accuracy to which an answer is given. For example, if 3 significant figures are expected (either because of an explicit instruction or because the general context of a problem demands it) but only 2 are given, loss of an accuracy ("A") mark is likely to be appropriate; but if 4 significant figures
are given, this should not normally be penalised. Likewise, answers which are slightly deviant from what is expected in a very minor manner (for example a Normal probability given, after an attempt at interpolation, as 0.6418 whereas 0.6417 was expected) should not be penalised. However, answers which are grossly over- or under-specified should normally result in the loss of a mark. This includes cases such as, for example, insistence that the value of a test statistic is (say) 2.128888446667 merely because that is the value that happened to come off the candidate's calculator. Note that this applies to answers that are given as final stages of calculations; intermediate working should usually be carried out, and quoted, to a greater degree of accuracy to avoid the danger of premature approximation.

The situation regarding any particular cases where the accuracy of the answer may be a marking issue should be detailed in the mark scheme rationale. If in doubt, contact your Team Leader.

Rules for replaced work
If a candidate attempts a question more than once, and indicates which attempt he/she wishes to be marked, then examiners should do as the candidate requests.

If there are two or more attempts at a question which have not been crossed out, examiners should mark what appears to be the last (complete) attempt and ignore the others.

NB Follow these maths-specific instructions rather than those in the assessor handbook.
Genuine misreading (of numbers or symbols, occasionally even of text) occurs. If this results in the object and/or difficulty of the question being considerably changed, it is likely that all the marks for that question, or section of the question, will be lost. However, misreads are often such that the object and/or difficulty remain substantially unaltered; these cases are considered below.

The simple rule is that all method ("M") marks [and of course all independent ("B") marks] remain accessible but at least some accuracy ("A") marks do not. It is difficult to legislate in an overall sense beyond this global statement because misreads, even when the object and/or difficulty remains unchanged, can vary greatly in their effects. For example, a misread of 1.02 as 10.2 (perhaps as a quoted value of a sample mean) may well be catastrophic; whereas a misread of 1.6748 as 1.6746 may have so slight an effect as to be almost unnoticeable in the candidate's work.

A misread should normally attract some penalty, though this would often be only 1 mark and should rarely if ever be more than 2. Commonly in sections of questions where there is a numerical answer either at the end of the section or to be obtained and commented on (eg the value of a test statistic), this answer will have an " A " mark that may actually be designated as "cao" [correct answer only]. This should be interpreted strictly - if the misread has led to failure to obtain this value, then this "A" mark must be withheld even if all method marks have been earned. It will also often be the case that such a mark is implicitly "cao"
even if not explicitly designated as such.
On the other hand, we commonly allow "fresh starts" within a question or part of question. For example, a follow-through of the candidate's value of a test statistic is generally allowed (and often explicitly stated as such within the marking scheme), so that the candidate may exhibit knowledge of how to compare it with a critical value and draw conclusions. Such "fresh starts" are not affected by any earlier misreads.

A misread may be of a symbol rather than a number - for example, an algebraic symbol in a mathematical expression. Such misreads are more likely to bring about a considerable change in the object and/or difficulty of the question; but, if they do not, they should be treated as far as possible in the same way as numerical misreads, mutatis mutandis. This also applied to misreads of text, which are fairly rare but can cause major problems in fair marking.

The situation regarding any particular cases that arise while you are marking for which you feel you need detailed guidance should be discussed with your Team Leader.

Note that a miscopy of the candidate's own working is not a misread but an accuracy error.

| Question |  |  | Answer | Marks | Guidance |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
